EPDM and Butyl PLUS membranes being resistant for the use with various water qualities

Dear Customer

we confirm that the EPDM and the Butyl Plus rubber membranes are suitable to contact with various water quality (glycol solution up to 40% and the corresponding temperature dropping to -40° C and up to 100° C, or softened water/nitrogen): result of tests performed by external laboratory, shows that the physical-chemical characteristics do not change after aging tests.

Then, chemical resistance of both EPDM and Butyl Plus is excellent and minimum change of physic-chemical properties is present, according requirements of chemical compatibility.

Best regards

Giovanni Carli
Quality Department
